

Key words

animal signals

At the same time, though, the idea of functional reference represents a conceptual retreat in acknowledging that **animal signals** may never meet the semantic sine qua non of human language

influence

Such sounds are common in infants and juveniles who otherwise have little **influence** on the behaviour of older and larger individuals.

asymmetries

The alternatives we advocate also explicitly acknowledge the different roles and often divergent interests of signallers and perceivers that can yield fundamental **asymmetries** in signalling interactions, and they therefore shift the focus of interpretations of animal communication from informing others to influencing others.

meaning

This commonality is evident even when research goals are very different, for example when primate vocalizations are proposed to have word-like **meaning**, or sexually selected signals are proposed to convey information about a signaller's underlying quality.

animal communication

Animal communication studies often use analogies to human language and related constructs such as information encoding and transfer.

language

Studies of primate communication are often couched in the metaphor of **language** where meaning is the central explanatory construct and arises from the common representational states of speakers and listeners.

Example sentences

1. Animal signals in animal communication can influence others without having clear language-like meaning.
2. Asymmetries between sender and receiver show that animal signals and human language work in different ways.

Topical Vocabulary

Communication theory

Word from text	Word family members
information	informative
transmission	transmit
signal design	designer
sender	to send
receiver	reception

Primate communication

Word from text	Word family members
primate vocalizations	to vocalize
alarm calls	alarming
predators	predation
startle responses	to startle
vocal behaviour	behavioural

Sexual selection and courtship

Word from text	Word family members
sexual selection	sexually
courtship signals	to court
male attraction	attractive
female receptivity	receptive
sensory exploitation	to exploit

Passive - Vocal behaviour is modulated primarily by involuntary processes involving subcortical brain structures

Nominalisations - information exchange from which both sender and receiver benefit

Ex.1 Match each English word with its correct Polish equivalent.

- | | |
|----------------|------------------|
| 1 Infer | a) współczesny |
| 2 frequency | b) żaby |
| 3 properties | c) właściwości |
| 4 contemporary | d) wnioskować |
| 5 frogs | e) częstotliwość |

Ex.2

Words: victims piercing sensitivity elicit mutualistic

- 1 In this species, the ears show high to high-frequency noises.
- 2 Predator–prey interactions are usually not , because only one side benefits.
- 3 often scream loudly when they are attacked.
- 4 The alarm call had a sound that was impossible to ignore.
- 5 Such cries can a rapid escape response from nearby animals.

ANSWERS:

Ex1

1d

2e

3c

4a

5b

Ex2

1 Sensitivity

2 Mutualistic

3 Victims

4 Piercing

5 Elicit
